Hi!

I am skilled software engineer who has extensive experience of building platforms for product companies.

In my previous roles, I have excelled as a member of small-sized, autonomous teams, typically comprising up to 10 individuals. I prefer environments that prioritise the agile approach to delivery processes, where collaboration and direct communication between engineers and product owners/stakeholders is a pivotal aspect. I always try to find/establish such links whenever possible, as I believe this significantly enhances the quality and efficiency of delivered results.

I am an advocate for a 'horizontal' style of communication and collaboration in the workplace, promoting an open exchange of ideas and fostering a cohesive team atmosphere.

My skillset is centered around backend application development, encompassing architecture design, implementation and operational aspects. I am well versed in setting up CI/CD, implementing monitoring/alerting and deploying/maintaining required infrastructure.

While I have extensive experience with technologies such as Python, Kubernetes, and AWS, I am committed to a language and tech-agnostic approach.

Thank you in advance for considering my application.

Sincerely, Artem Roma
